

Document Signature App — Python Stack

Introduction

The **Document Signature App** is a secure, scalable web application that enables users to **upload PDFs, place digital signatures, share signing links, and generate signed documents with audit trails.**

This Python-based implementation focuses on **backend reliability, security, and data integrity**, making it ideal for **legal, HR, finance, and enterprise workflows** where traceability and compliance matter.

By using Python frameworks and libraries, this project mirrors how **real-world SaaS products** handle document signing while remaining beginner-friendly and production-ready.
